1.5BIA							

¹ Source: Riverbank Acoustical Laboratories. Test conducted with 1.50 pcf fiberglass batts and 2" polyisocyanurate foam insulation for the SDI.

Type B (wide rib) deck provides excellent structural load carrying capacity per pound of steel utilized, and its nestable design eliminates the need for die-set ends. 1" or more rigid insulation is required for Type B deck. Acoustical deck (Type BA, BIA) is particularly suitable in structures such as auditoriums, schools, and theatres where sound control is desirable. Acoustic perforations are located in the vertical webs where the load carrying properties are negligibly affected (less than 5%). Inert, non-organic glass fiber sound absorbing batts are placed in the rib openings to absorb up to 60% of the sound striking the deck.

VERTICAL LOADS

No. of Spans	Deck Gauge	Max SDI Constr. Span	Allowable Total (Dead + Live) Uniform Load (PSF)										
			Span (ft.-in.)		C. to C. of Support								
			5-0	5-6	6-0	6-6	7-0	7-6	8-0	8-6	9-0	9-6	10-0

1. Load tables are calculated using sectional properties based on the steel design thickness shown in the Steel Deck Institute Design Manual.

2. Loads shown in the shaded areas are governed by the live load deflection not in excess of 1/240 of the span. A dead load of 10 PSF has been included.
